

How to Forward your Domain to our Network: Changing DNS Settings

If you currently own a domain name, and would like to forward it's DNS (Domain Name System) to OpenPublic Networks' systems; please follow the steps below:

NOTE: Only the owner of a domain name has access to make these changes.

1. Visit the website where you purchased your domain name from. Locate the Administration panel, and log in.
2. Locate the DNS or Domain Name System settings. These options may be located within the Domain section. Now locate your domain name, and locate a section to manage your domain's "nameservers".
3. Add the following details as a custom name server:
Name Server 1: NS1.OPENPUBLIC.NET
Name Server 2: NS2.OPENPUBLIC.NET
4. Make sure to save your changes and log out.

NOTE: Due to the nature of the internet, DNS changes often take 24-48 hours to update. Please make a note of this, as your website will not be accessible until the DNS changes are finalized.
